AutoCAD is available as an iOS and Android app, a web-based version called AutoCAD.com, and as AutoCAD LT for Windows. AutoCAD LT is an AutoCAD version geared towards smaller companies. AutoCAD LT has been available for Windows only since the spring of 2013. Before then, it was available only for Mac. AutoCAD LT for Windows is available only as a perpetual license, and as such can not be installed or registered on a Mac computer. AutoCAD LT for Mac does not require a perpetual license. AutoCAD is licensed on a perpetual basis, meaning it can be installed and used by one individual and resold to one additional individual without a license fee. AutoCAD can only be licensed to one individual, and it is sold at a set, one-time cost. AutoCAD may only be installed in one physical location, but only one license may be installed in that location. AutoCAD can be downloaded for personal use. AutoCAD LT for Windows is licensed on a perpetual basis, but only to one individual and resold to one additional individual, for a set cost. In addition to offering CAD software, Autodesk also produces two other major applications, the 3D design and animation tool, 3ds Max, and the music and audio mixing program, Mix. AutoCAD (Desktop) AutoCAD is a desktop app available for Windows, macOS and Linux computers. It was the first commercially available CAD program. Before AutoCAD, most CAD programs ran on minicomputers or mainframes, and were based on very different software philosophies. AutoCAD is based on the GIS (geographic information systems) concept developed by ESRI in the 1970s and 1980s, which requires the user to be able to load the design (drawings and data) onto the computer from a storage medium (disk drive or database). AutoCAD was one of the first CAD programs to include graphics on a computer screen. Prior to AutoCAD, CAD users would "rasterize"

The concept of GIS relies on computer-aided design. Hence, the CAD application must be able to handle GIS data. In AutoCAD this is achieved with the CAD Database Standard version 1.1 and later. The function is accessible through the (DBT) DataBase Tools. Data Exchange The most important file format for CAD is the standard drawing exchange format (DXF). It supports binary format and ASCII format and contains a complex set of tags which together describe the graphical part, its hierarchy, its geometrical elements, its dimension lines, its text labels, its materials, the annotation of the CAD drawing. CAD files are always referenced by unique file names which allow to manage the drawings on computers. Metadata The CAD Application in AutoCAD supports metadata creation and reading. Metadata can be read from files and drawn directly into a database. In many CAD products, the information stored within the CAD product is based on the metadata and the underlying database. The metadata is defined on a file level and a database level. The database contains additional information such as line type, dimension values, line colors, material colors and layer information. Metadata is stored in the database in the form of comments within the drawing. For example, attributes such as size, weight, color, text and label information can be stored in the metadata. Information Management CAD has been developed to handle a variety of information and has a file system similar to that of other CAD products. The information in CAD is stored in one or more database files which can be linked to the main drawings (part files). The database files can be of various formats such as SDT, SDMX, XML, or others. Rendering For the creation of CAD drawings from scratch or the modification of CAD drawings, the rendering must be exactly how a CAD user would see the drawing on-screen. In CAD this is usually done using

the RENDER command. It requires a Drawing Manager (DM) that manages and manages the rendering through the appropriate drawing managers. The DM enables dynamic re-rendering of drawings and allows dynamic linking between the Rendering and DM managers. Accessing CAD drawings CAD is normally accessed on a server through a communication protocol. When using the server, the request for the actual drawing information is passed through the network to the server, which then delivers the drawing to the requesting client. There are numerous standards for the communication protocols a1d647c40b
