Once again, thank you! I will not forget about you. Wait for my next update! Baixar Re-Loader - Activador Windows E Office By SobreTechMz - Q: Is it possible to set the values of SQLite rows in Java? This is probably a stupid question but I am new to SQLite (and Java). I have a database, which holds data for points in a city. All the points are in a certain area. A point is named with a name. It should be a straight line (1,1) (X,Y) (X,Y+1) (X+1,Y+1). Is there any way of accessing the data in the database from Java and setting a field with the value of the X coordinate of the new (X+1,Y+1) point? A: If your table is called coords and has the fields X and Y as text type columns, try using: `String sql = "UPDATE coords SET X=?, Y=?"; PreparedStatement stmt = con.prepareStatement(sql); stmt.setString(1, X); stmt.setString(2, Y); stmt.executeUpdate();` For the next row, just change the ? for X and Y and re-execute as shown above. If you're using Java 1.7 or later, you might prefer the new `ResultSet.updateRow()` method. Google: Worldwide SEO May Lose Focus There's been recent talk about the growing threat of SEO "black hat" tactics impacting SEO and search quality. This is especially true of those tactics that exploit user's privacy and security weaknesses. These black hat tactics are largely responsible for Google Panda being rolled out in March of 2013. One key factor behind the increases in importance placed on the quality of Google search results is the rise of Adwords and social advertising. It's estimated that by 2020, nearly half of all online marketing will be focused on paid search and social. Whether a business wants to stay on the "good" side of things or wants to get on the "bad" side of things, there is one truth that will always be true. Search engines will always be there and without a search engine there would not be a search engine business. The following infographic shows just how complicated the
